DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. <u>Claims 1, 2, 3, 4, 6, 7, 9, and 10</u> are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 5,359,436 to Dichter et al.

Regarding <u>Claim 1</u>, Dichter et al. disclose a method of generating a black component of an output color comprising:

receiving input color data defined in a first color space (C_{ORIG} , M_{ORIG} , Y_{ORIG} are received as input to Element 2, refer to Figure 1);

converting the received input color data to intermediate color data defined in an intermediate color space (C_{ORIG} , M_{ORIG} , Y_{ORIG} are converted to C_{NEW} , M_{NEW} , and Y_{NEW} by Element 2, refer to Figure 1);

calculating a first black component factor from the input color data (refer to Column 4 Lines 27-28, Column 5 Lines 50-51, and Column 7 Lines 20-21, and also Column 7 Lines 48-49);

Art Unit: 2626

calculating a second black component factor from the intermediate color data (refer to Column 4 Lines 34-35, Column 5 Lines 56-57, and Column 7 Lines 26-27, and also Column 7 Lines 54-55);

and

combining the first black component factor and the second black component factor (refer to Column 2 Lines 28-31, and also Column 4 Line 38, Column 5 Line 61, Column 7 Line 59).

Regarding <u>Claim 2</u>, the receiving input color data step as disclosed by Dichter et al. comprises receiving input color separation values (refer to Figure 1, C_{ORIG} , M_{ORIG} , Y_{ORIG}).

Regarding <u>Claim 3</u>, the Element 2 of Figure 1 in Dichter et al.'s invention converts the received input color data to CMY (refer to Figure 1 Element 2).

Regarding <u>Claim 4</u>, Dichter et al. disclose the calculation of the first black component factor by applying a function to the input color separation values (f_{skeleton} black{smallest of Y_{original}, M_{original}, C_{original}}, refer to Column 7 Lines 55-56) where the function depends on predefined threshold values (the predefined threshold value is the smallest of Y_{original}, M_{original}, C_{original}).

444.34.0000

Art Unit: 2626

Regarding <u>Claim 6</u>, Dichter et al. disclose the calculation of the second black component factor from the converted CMY values (refer to Column 4 Lines 34-35, Column 5 Lines 56-57, and Column 7 Lines 27-28).

Regarding <u>Claim 7</u>, Dichter et al. disclose an image output terminal, a method of outputting a digital color image comprising:

converting input components corresponding to a color in a first color space (refer to Figure 1, C_{ORIG}, M_{ORIG}, Y_{ORIG}) to intermediate components in a second color space (C_{ORIG}, M_{ORIG}, Y_{ORIG} are converted to C_{NEW}, M_{NEW}, and Y_{NEW} by Element 2, refer to Figure 1), where the second color space includes only chromatic components (only C_{NEW}, M_{NEW}, and Y_{NEW}), and deriving an output black component from both the intermediate components and the input components (refer to Column 7 Line 60).

Regarding <u>Claim 9</u>, Dichter et al. disclose the output data comprising the intermediate components (refer to Figure 1 Elements CNEW, MNEW, YNEW) and the output black component (refer to Figure 1 Element K RECALC.).

Regarding <u>Claim 10</u>, the method of outputting a digital color image as set forth in claim 7, where the deriving an output black component comprises:

Art Unit: 2626

applying a defined process to the input components (refer to Column 4 Lines 27-28, Column 5 Lines 50-51, and Column 7 Lines 20-21, and also Column 7 Lines 48-49),

applying a different process to the intermediate components (refer to Column 4
Lines 34-35, Column 5 Lines 56-57, and Column 7 Lines 26-27, and also Column
7 Lines 54-55), and
combining the processed input components and the differently processed
intermediate components (refer to Column 2 Lines 28-31, and also Column 4

2. <u>Claim 15</u> is rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 5,739,917 to Shu et al.

Line 38, Column 5 Line 61, Column 7 Line 59).

Regarding <u>Claim 15</u>, Shu et al. disclose a system for creating an achromatic component for an output color space from an input color space including only chromatic components, the system comprising:

a receiver that receives input color separations in the input color space (refer to Figure 4 Elements C, M, Y);

a converter that converts the input color separations to intermediate color separations (refer to Figure 4 Element 50); and an achromatic component generator (refer to Figure 4 Element 50) in data communication with the receiver and the converter, the achromatic component

Art Unit: 2626

generator calculating an achromatic color separation from functions including at least one input color separation and intermediate color separation (refer to Figure 4, the black component K is calculated by Element 50, and UCR is performed).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

3. <u>Claim 5</u> is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 5,359,436 to Dichter et al.

Regarding <u>Claim 5</u>, Dichter et al. disclose that the HSL changes are applied directly to the CMY space (refer to Column 1 Lines 64-65) instead of first converting the CMY values to HSL values and then applying the HSL changes (refer to Column 1 Lines 16-21). Dichter et al. do not describe the use of HSV color space.

However, one having ordinary skill in the art would recognize that HSL and HSV color spaces are quite similar color space. They are actually the different forms of the HSV cylindrical space. The only difference is that in order to get the white color in the HSV color space, saturation value should be set to zero (0). On the other hand, in HSL color space, the white color is achieved by setting the luminance value to one (1)

Art Unit: 2626

regardless of the saturation value. Therefore, it would have been obvious to one having ordinary skill in the art to easily use the HSV instead of the HSL color space as disclosed in Dichter et al.'s invention.

4. <u>Claims 8, and 11</u> are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 5,359,436 to Dichter et al. in view of U.S. Patent No. 5,739,917 to Shu et al.

Regarding <u>Claim 8</u>, Dichter et al. disclose the conversion of input components in a first color space (refer to Figure 1, C_{ORIG}, M_{ORIG}, Y_{ORIG}) to components in a second color space (C_{ORIG}, M_{ORIG}, Y_{ORIG} are converted to C_{NEW}, M_{NEW}, and Y_{NEW} by Element 2, refer to Figure 1), and the generation of the black component from the first and second color space components (refer to Column 7 Line 60). However, Dichter et al. do not disclose that the components in the second color space are adjusted based on the calculated black component.

Shu et al. also disclose the conversion (performed by Element 50 of Figure 4) of input components in a first color space (refer to Figure 4, C, M, and Y) to components in a second color space (refer to Figure 4, C', M', Y', K). According to Shu et al., Element 50 of Figure 4 performs UCR. UCR is well known in the art, and is also described by Shu et al. The purpose of UCR is to replace equal amounts of the three colors CMY with black ink (refer to Column 4 Lines 56-61). Hence, the components in the second color space (C', M', Y', K) are adjusted based on K.

Application/Control Number: 09/896,460 Page 8

Art Unit: 2626

Therefore, it would have been obvious to one having ordinary skill in the art to apply UCR to Dichter et al.'s invention. The motivation to do so is to reduce the amount of color ink used, and therefore color ink cost is also reduced. The ink cost is reduced because the amount of color ink being used is reduced, and black ink is less expensive than color ink.

Regarding Claim 11, Dichter et al. do not teach the minimization of the CMY values in the intermediate color space.

Shu et al., however, disclose the use of UCR in which the lowest of C, M, and Y values are subtracted from all three and assign that value to K (refer to Column 4 Lines 56-61). Therefore CMY values are minimized.

Allowable Subject Matter

- 5. Claims 12, 13, 14, 16, 17, and 18 are allowable.
- 6. <u>Claims 12, 13, 14, 16, 17, and 18</u> are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

.

Art Unit: 2626

Examiner's Remarks

ş

With respect to amendment claim 1, the Dichter reference teaches a plurality of first defined color components, C(orig), M(orig) and Y(orig). Dichter teaches a converter 2 for performing the intermediate color space so that the input values are expressed in terms of second components (C(new), Y(new) and M(new)). Note that the original components and the new components are not the same.

Applicant argues at the bottom of page 6 that the new and the original components are the same. The examiner strongly disagrees with this assertion. First, the CMY original components are transformed, via circuit 2 by means of HSL changes. Hence, the new values could not possibly be the same as the new.

With regard to claim 7 and applicant's assertion of the first and second components being the same, the examiner contends that this is incorrect for the same reasons as presented in the response to claim 1.

Art Unit: 2626

With respect to applicant's argument addressing claim 15, Shu teaches a circuit 50 which takes CMY values and produces CMY and K values, K representing black or the achromatic color, CMY representing the chromatic values. Hence, the rejection of claim 15 using Shu is proper to show a member that generates both chromatic and achromatic values.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Art Unit: 2626

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jerome Grant II whose telephone number is 571-272-7463. The examiner can normally be reached on Mon.-Thurs. from 9:00 to 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kimberly A. Williams, can be reached on 571-272-7463. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
